# **Objectives**

#### Main objective

To develop an anticipated management and control model for the implementation of infrastructure projects in countries with high geopolitical risks, the case of Palestine

#### **Secondary Objectives**

- Analysis of the current situation for the implementation of infrastructure projects in Palestine.
- Development of conceptual model.
- Model application.

Phase I: Analysis of the current situation for the implementation of infrastructure projects in Palestine

The concepts of systems theory were used to analyze the implementation process of infrastructure projects. This analysis includes the following:

- Boundaries of "Infrastructure project" System.
- Phases of the system life cycle.
- System agents:
  - Analysis of legal, contractual and project delivery methods.
  - Analysis of financial mechanisms.
  - Analysis of design procedure and tendering documents.
  - Analysis of construction phase.
- Infrastructure interdependency.

#### **Results** Methodology · Legal and contractual models · Financial mechanisms. I. Analysis of current · Design procedure and tendering doc situation · Construction phase Phase II: Development of the Anticipated Cost · Project agents · Risks · Model variables Mathematical models for risk ass II. - 3. Legal regulation
- 4. Contractual models
- 5. Designers
- 6. Contractors
- 7. Project Managers
- 8. Type of Infrastructure

## 2. Risks affecting the implementation of construction projects

Methodology used to identify risk factors:

- Literature review:
  - Delays and cost overruns factors.
  - Variations and claims.
  - Contingency.
- Analysis of historical data for a sample of infrastructure projects:
  - 28 projects with 89 variation order.
- Risk classification Risk Breakdown Structure (RBS).

# **Fuzzy Contingency Estimator (FCE)**

## 2. Fuzzy expert model

A fuzzy expert system consists of :

- A fuzzification interface that accepts input from the user.
- A knowledge base that consists of a rule base and a database;
- An inference engine.
- A defuzzification interface that provides output to the user.

Determination of model variables.

Analysis of mathematical models for risk assessment.

Development of risk assessment model.

Establish the general conceptual model.

- Easy to apply.
- Anticipate risks before they occur.
- Quantify, in advance and subjectively, the negative impacts of risks on project objectives - cost and time.
- Propose measures to avoid the negative impacts of risks.
- Establish mechanisms to mitigate the negative effects of uncontrollable risks.

Systemic approach for CCA model.

Sample of risk impact assessment using FCE during the design phase.

Sample of risk impact assessment using FCE during the Pre-liquidation phase.

# Future research

## Future research

- Development of anticipated cost control platform (software) for the implementation of infrastructure projects in countries with high geopolitical risk.
- Development of conceptual model for the analysis and assessment of infrastructure needs.
- Analyze the governance of infrastructures in Palestine.
- Development of cost estimation model and detailed cost index for construction projects in Palestine.
- Study the integration of System dynamics with fuzzy logic for assessment of risks and compare results with FCE model.
